

Tumhare code me theme ke **CSS variables** kaafi organized hain — basically tumne Tailwind ke saath ek **design token system** bana rakha hai jo light aur dark mode me automatic adapt ho jata hai. Main tumhe **saare variables** ka list bana ke unka **meaning + use case** bata deta hoon.

🎨 Color Variables

Base Colors

--radius-xl	Extra large radius (base + 4px)

⚙️ Extra Utility Variables

Variable	Meaning
--header-height	Header height (60px)
--animate-scroll	Scroll animation config

Mujhe lagta hai tumne color system itna modular banaya hai ki tum kisi bhi component me bas `bg-primary` ya `text-muted-foreground` likh ke light/dark dono mode ka support free me le sakte ho.

Agar tum chaho to main tumhare liye iska **Tailwind color token cheatsheet** bana sakta hoon jo designers + devs dono use kar sake.
